# LEGISLATIVE & REGULATORY CONTEXT

## CANADIAN ENVIRONMENTAL PROTECTION ACT, 1999 (CEPA)

- CEPA provides the framework for the identification, prioritization, and assessment of new and existing substances and for the control or management of those considered to pose a risk.
- This framework is broad, open, transparent and evidence-based, taking into account aspects (i.e., exposure and effects) of a substance related to the potential risk it may pose, and it builds upon work done in other jurisdictions.
- CEPA defines substances very broadly, including:
  - chemicals, polymers, biochemicals, biopolymers, nanomaterials, products of biotechnology, air pollutants and GHGs.

### CEPA Review:

- Section 343 of CEPA provides for a parliamentary review of the administration of the Act every five years
- June, 2017: ENVI Committee Report: “Healthy Environment, Healthy Canadians, Healthy Economy: Strengthening the Canadian Environmental Protection Act, 1999”
- June, 2018: Follow-up report to the Standing Committee on the Canadian Environmental Protection Act
- **2021-ongoing: Bill S-5, Act to amend CEPA ([Strengthening Environmental Protection for a Healthier Canada Act](#))**

CONSOLIDATION

CODIFICATION

Canadian Environmental  
Protection Act, 1999

Loi canadienne sur la protection  
de l'environnement (1999)

S.C. 1999, c. 33

L.C. 1999, ch. 33

Canada

Prime Minister of Canada  
Justin Trudeau

## Minister of Health Mandate Letter

December 16, 2021

- .....
- To protect Canadians from harmful chemicals, strengthen the *Canadian Environmental Protection Act*, introduce mandatory labelling of chemicals in consumer products, *introduce legislation to end testing on animals*, increase testing of products for compliance with Canadian standards, and implement an action plan to protect Canadians, including firefighters, from exposure to toxic flame retardants found in household products.
- .....

## Bill S-5, Strengthening Environmental Protection for a Healthier Canada Act - Summary of Amendments

The following is intended to provide a plain language summary of key amendments put forward in Bill S-5, *Strengthening Environmental Protection for a Healthier Canada Act*. For the comprehensive and detailed list of the amendments, please refer to the Bill.

February 9, 2022

### KEY THEMES:

- A Right to a Healthy Environment
- Protecting Vulnerable Populations
- Assessing Real Life Exposures
- Supporting the Shift to Safer Chemicals
- Increased Transparency in Decision-Making
- Reducing Reliance on Animal Testing
- Informing Canadians of Risks (e.g. Labelling)

Full summary available [\[here\]](#)

# LEGISLATIVE & REGULATORY CONTEXT

Opportunities for New Approach Methods (NAM) to effectively support risk assessment is dependent on requirements

Toxicology Studies	Pesticides – PCPA (Possible requirements depending on use category)	New Substances CEPA / New Substances Notification Regulations	Existing Substances CEPA - Industrial Chemicals
Acute Toxicity (oral, dermal, inhalation)	X	X	-
Eye / Dermal Irritation, Dermal Sensitization	X	X	-
Repeated Dose Toxicity 28-day (oral, dermal)	X	X (~90% OECD GD 407) *	-
Subacute Inhalation Toxicity 28-day	X	X	-
Repeated Dose Toxicity 90-day (oral, dermal, inhalation and/or 12-month dog for oral)	X	X (6-7% OECD GD 408) *	-
Combined Repeated Dose Toxicity with Reproduction/Developmental Toxicity Screening Test	X	X (3-4% OECD 422) *	-
Subchronic Toxicity 90-day (dermal, inhalation)	X		-
Chronic Toxicity (rodent)	X		-
Oncogenicity (two rodent species)	X		-
Combined Chronic Toxicity / Oncogenicity (rodent)	X		-
Multigeneration Reproductive Toxicity (rodent)	X		-
Prenatal Developmental Toxicity (rodent and non-rodent)	X		-
Genotoxicity (various in vitro, in vivo studies)	X	X	-
Metabolism/Toxicokinetics in mammals	X		-
Acute delayed Neurotoxicity (hen); 28-day Delayed Neurotoxicity (hen)	X		-
Acute Neurotoxicity (rat)	X		-
90-day Neurotoxicity (rat)	X		-
Developmental Neurotoxicity	X		-

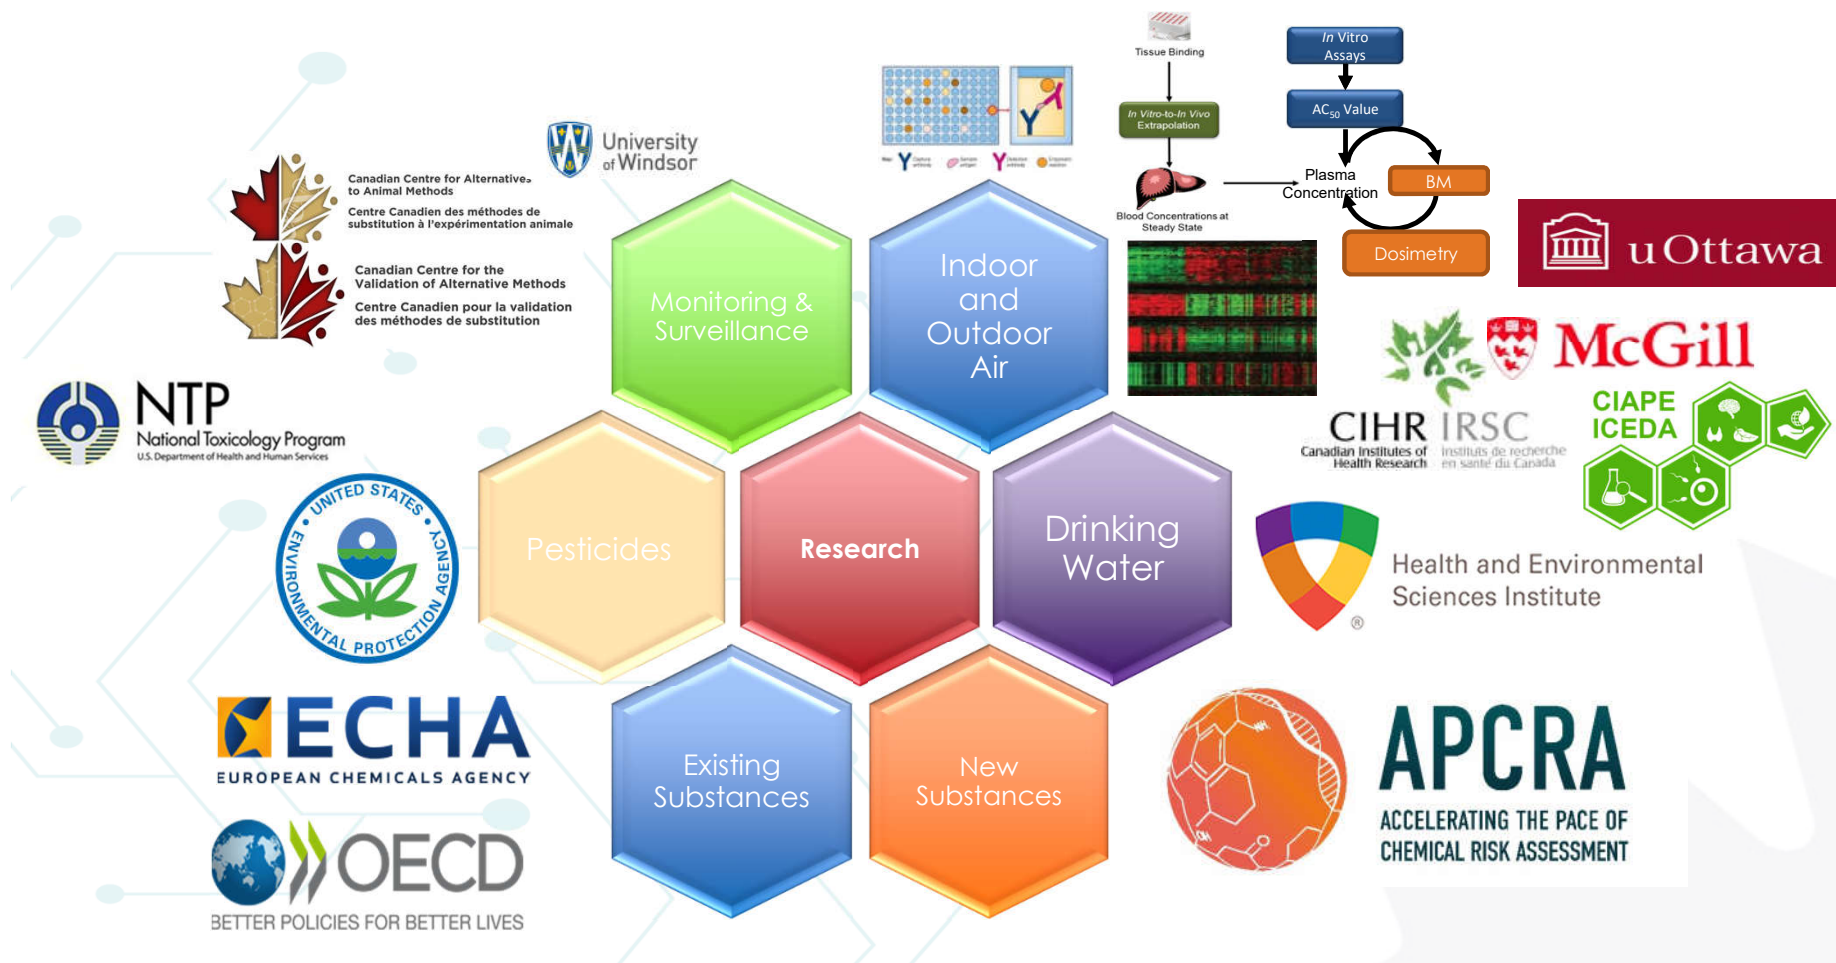

\* Schedule 6 & 11 (>10 000 kg)

## Common Goals

- Protect human health & the environment
- Reduce · Replace · Refine approaches to animal testing
- Promote acceptance of NAM in fit-for-purpose uses
- Partnerships and collaborations to increase alignment
- Case examples to build confidence
- Gain experience through evidence integration, IATA, DAs, etc.
- Establish best practices and guidance (e.g. OECD)

**OPTIMIZE PACE, ACCURACY AND EFFICIENCY OF RISK ASSESSMENT**

# PARTNERSHIPS & ENGAGEMENT ARE CRITICAL FOR MODERNIZATION

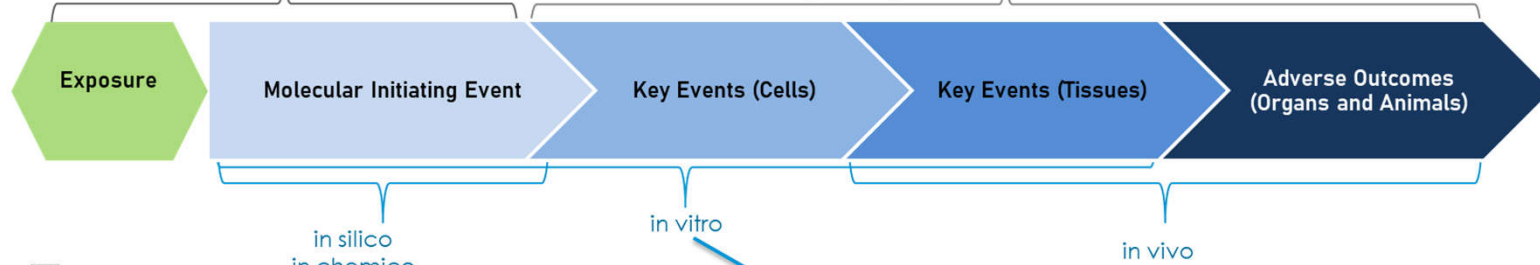

# INNOVATE & ACCELERATE THE USE OF NAM: DEVELOPING FIT-FOR-PURPOSE APPROACHES

## CONVERTING IN VITRO CONCENTRATIONS TO HUMAN RELEVANT DOSES

## ADVERSE OUTCOME PATHWAY (AOP)

### MACHINE LEARNING TECHNIQUES

- Predictive models, Artificial Intelligence (AI)
- Natural Language Processing

### NETWORK SIMILARITY MODELS

Identify clusters of substances with the potential for toxicity to prioritize substances with limited or no toxicity information

### USE OF HIGH THROUGHPUT/CONTENT CELL-BASED ASSAYS

- Targeted in vitro assays, Transcriptomics assays
- Protective & predictive approaches

Identifying Potential Hazards

- Cancer
- ReproTox
- DevTox
- PulmonaryTox
- NeuroTox
- ImmunoTox

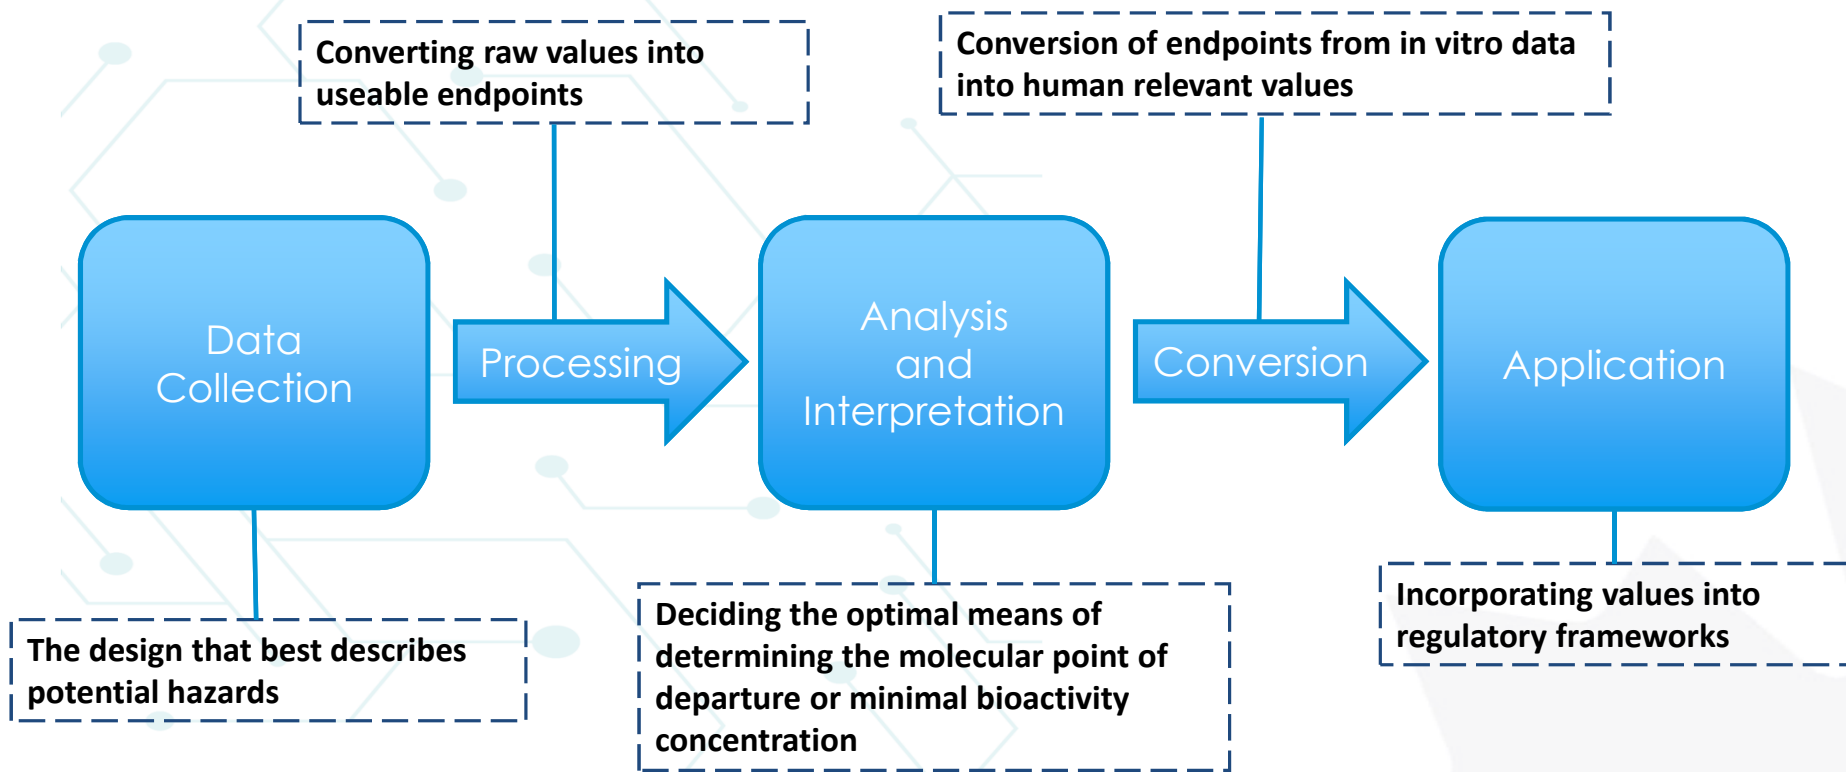

EXPLORING COMPUTATIONAL AND NOVEL TESTING STRATEGIES ACROSS LEVELS OF BIOLOGICAL ORGANIZATION TO DEVELOP INTERPRETATION AND APPLICATION APPROACHES TO UNDERSTAND THE DATA IN REGULATORY USE CONTEXTS

# TRANSLATING CASE STUDY FINDINGS

Regulatory  
Acceptance

# IN VITRO CASE STUDY FINDINGS TO ESTABLISH HUMAN RELEVANT ENDPOINTS

# CASE STUDY: BIOACTIVITY EXPOSURE RATIO (BER) APPLICATION IN PRIORITY SETTING AND RISK ASSESSMENT

## IN VITRO BIOACTIVITY AS A CONSERVATIVE POINT OF DEPARTURE: A RETROSPECTIVE CASE STUDY

- A quantitative risk-based approach to identify substances according to their level of concern to human health (low vs. high)
- Considers high-throughput *in vitro* bioactivity together with high-throughput toxicokinetic modelling to derive *in vitro* points of departure using ToxCast data
- Does the *in vitro* POD serve as a protective surrogate in the absence of traditional toxicological data

# CASE STUDY: BIOACTIVITY EXPOSURE RATIO (BER) APPLICATION IN PRIORITY SETTING AND RISK ASSESSMENT

## US EPA ToxCast/Tox21

- Assays representing targets and pathways associated with toxicity

## Approach

~1,400 ToxCast Endpoints  
(*in vitro* studies)

Extract AC<sub>50</sub> values from  
ToxCast Endpoints

Carry Forward 5<sup>th</sup>  
Percentile AC<sub>50</sub>

*in vitro* to *in vivo*  
Extrapolation

Carry Forward 5<sup>th</sup>  
Percentile AED

POD<sub>Bioactivity</sub>

## Endpoint extraction

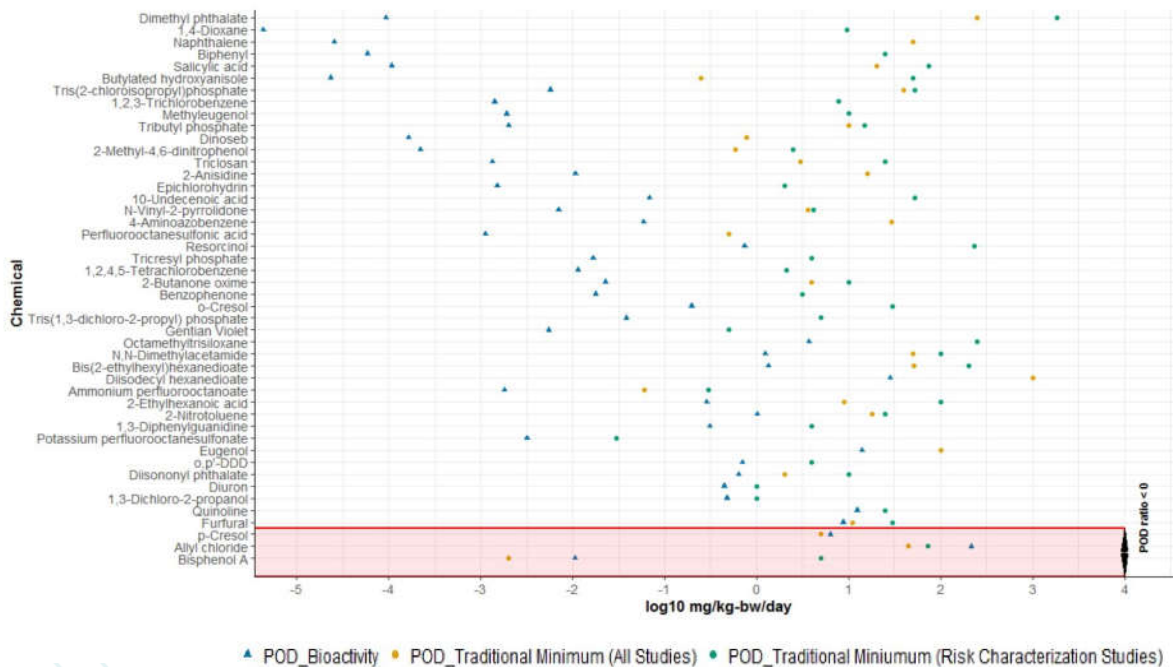

- The 5<sup>th</sup> percentile the AC<sub>50</sub> values from all assays meeting predetermined criteria

## Endpoint Conversion (IVIVE)

- Using HTKK R-based package
- µM → mg/kg/bw-day

## POD determination

- The 5<sup>th</sup> percentile of all outcomes from a specific chemical

For the vast majority of chemicals the *in vitro* values from ToxCast represents a lower (i.e., more conservative) endpoint when compared to the POD derived from *in vivo* data

# HEALTH CANADA SCIAD PRESENTS COMPARATIVE ANALYSIS

[Link to [BER SciAD](#)]

- $POD_{Bioactivity}$  values were derived for 40+ chemicals previously assessed under the Chemicals Management Plan (CMP)
- Compared  $POD_{Bioactivity}$  to POD used for risk characterization as well as lowest POD identified in the Screening Assessment Report (SAR)
- $POD_{Bioactivity}$  also compared to Canadian exposure values from biomonitoring data, environmental media, and consumer products to derive Bioactivity Exposure Ratios (BERs)
- BERs were evaluated to assess the utility of bioactivity data in prioritizing chemicals for risk assessment

## Traditional Risk Assessment

Repeat Dose, Developmental, and Reproductive Studies

Extract NO(A)ELs and LO(A)ELs from Animal Studies Assessed by Health Canada

Evaluators Identify Most Appropriate NO(A)EL or LO(A)EL for Risk Characterization

$POD_{Traditional}$

MOE

## BER Approach

~1,400 ToxCast Endpoints (*in vitro* studies)

Extract  $AC_{50}$  values from ToxCast Endpoints

Carry Forward 5<sup>th</sup> Percentile  $AC_{50}$

*in vitro* to *in vivo* Extrapolation

AED (mg/kg bw/day) based on upper 95<sup>th</sup> percentile steady state blood concentration representing a "sensitive" population

Carry Forward AED to Represent  $POD_{Bioactivity}$

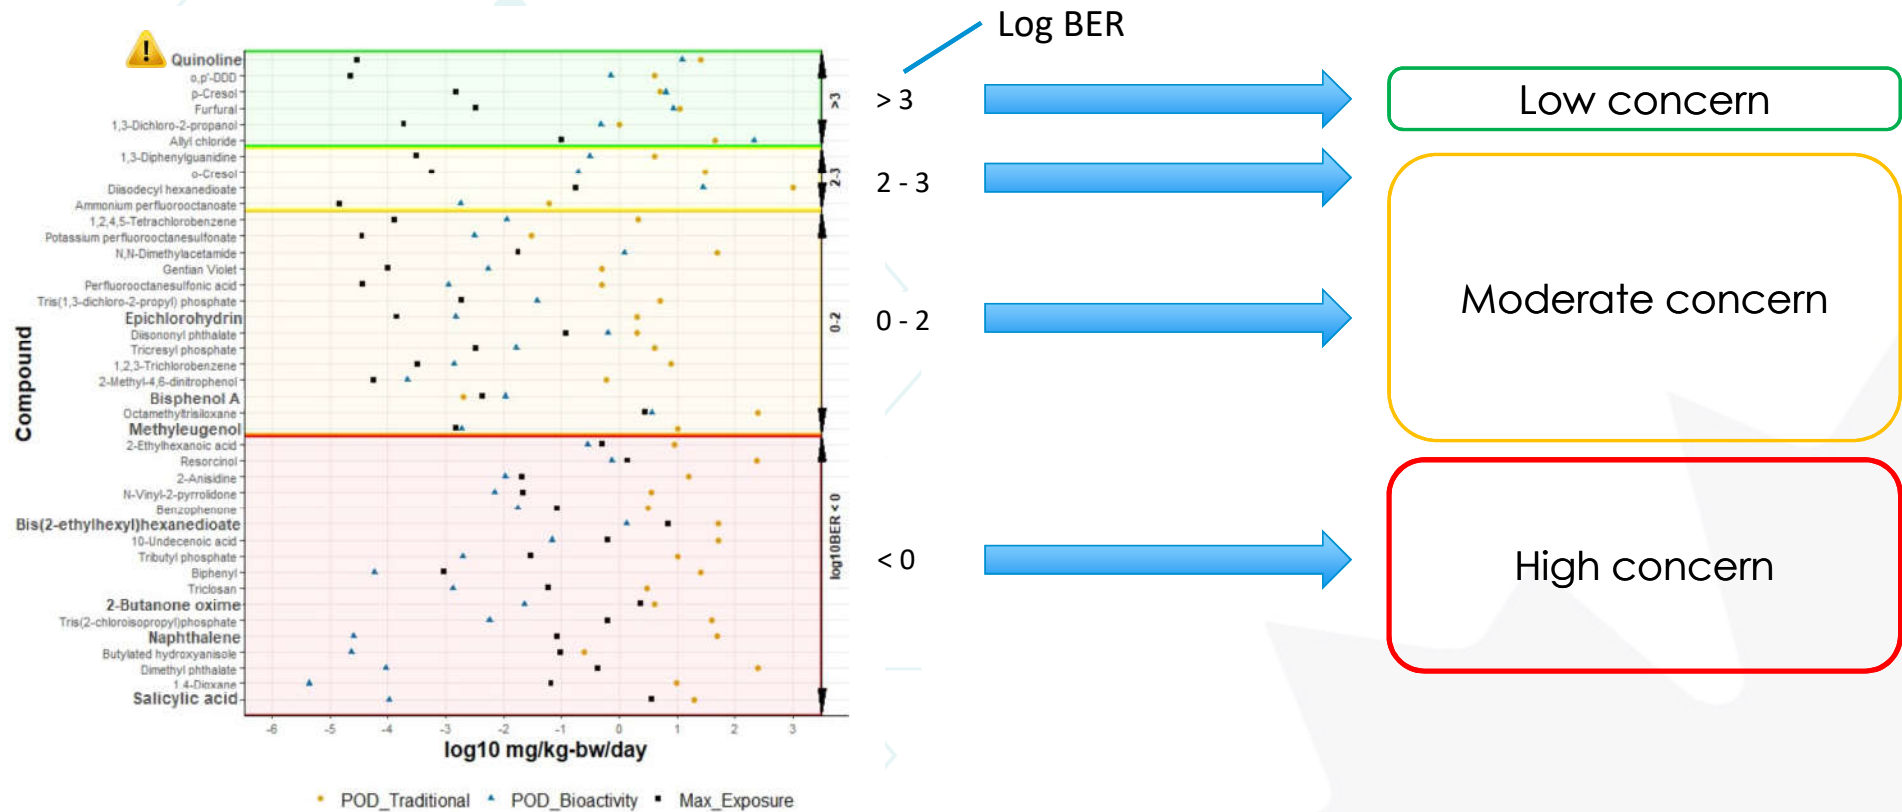

$POD_{Bioactivity}$

BER

Exposure Level for Canadian Population (mg/kg bw/day)

# ESTABLISHING TOXICOLOGICAL RELEVANCE

## BIOACTIVITY EXPOSURE RATIO (BER) – EXAMPLE FROM SCIAD

 [HESI GENETIC TOXICOLOGY TECHNICAL COMMITTEE]  
 [ACCELERATING THE PACE OF CHEMICAL RISK ASSESSMENT (APCRA)]

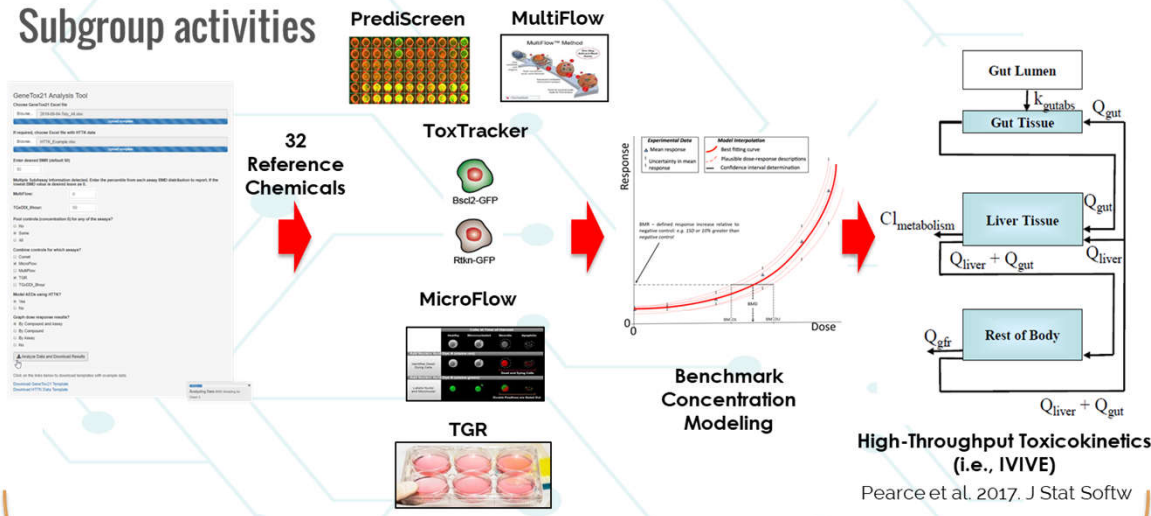

Health Canada Santé Canada

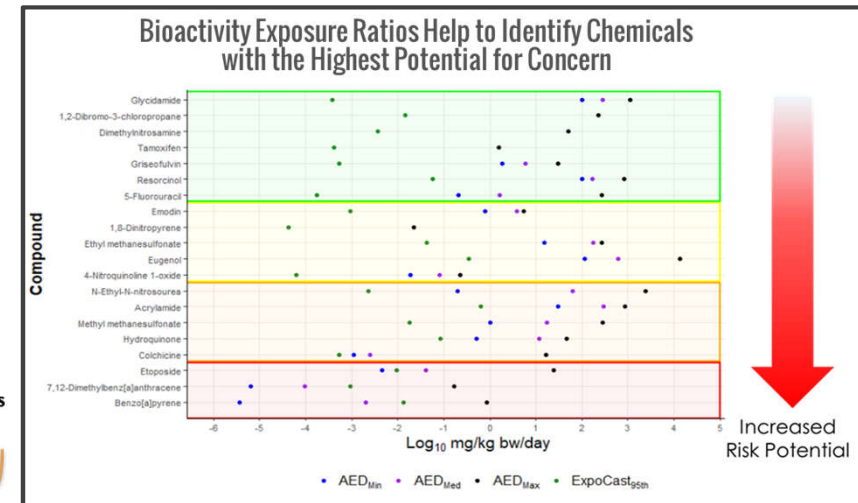

## COMPUTATIONAL TOXICOLOGY INCREASES UTILITY OF IN VITRO GENETOX DATA FOR HUMAN HEALTH RISK ASSESSMENT

### Subgroup activities

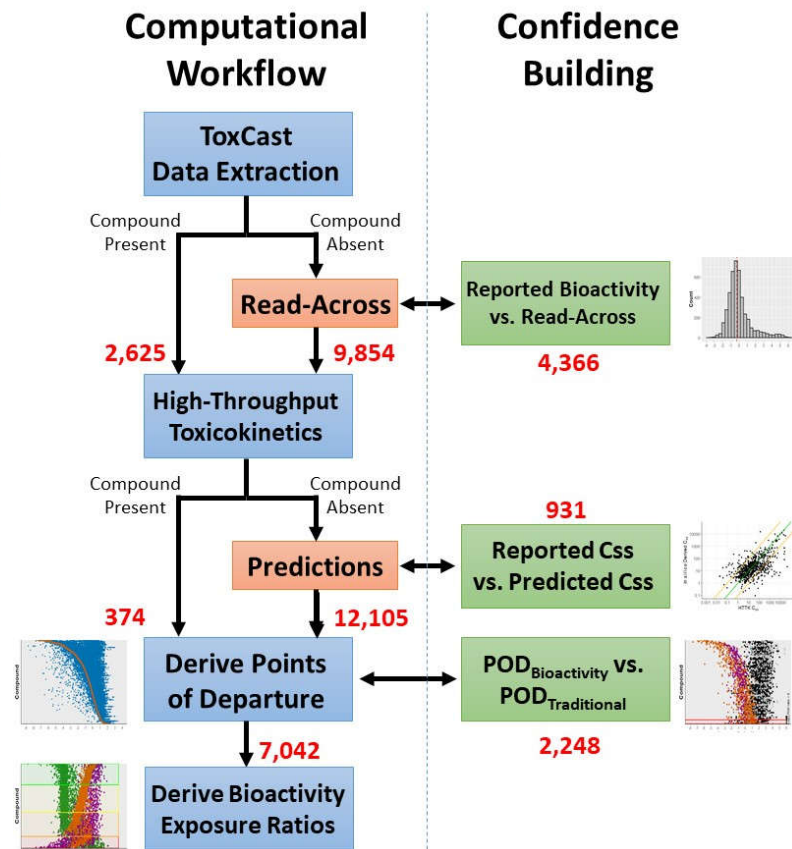

**Genotoxic Administered Equivalent Dose (AED; mg/kg bw/day)**  
Concentration observed to be toxic in cells converted to a human dose

# BUILDING ON EPA GENERALIZED READ-ACROSS (GENRA) TO EXPAND SCOPE OF BER APPROACH FOR PRIORITY SETTING

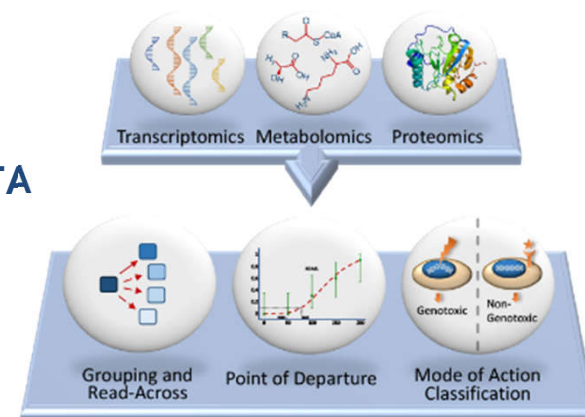

- Even with more rapid *in vitro* testing available it will be difficult /impractical to test all substances and their possible transformation products
- Filling in data gaps using **read-across and computational models** allows to examine large domestic inventories of data poor substances **to enhance identification of priority substances for further action**
- It is important that workflows remain flexible and modular to use the best available science of the time

# GAINING EXPERIENCE IN DERIVING IN VITRO POINTS OF DEPARTURE ACROSS TECHNOLOGIES

## DERIVING IN VITRO POINTS OF DEPARTURE USING TRANSCRIPTOMIC DATA

- A quantitative risk-based approach to identify potentially hazardous substances
- Changes in gene expression using high-throughput screening (i.e., high-throughput transcriptomics, HTTr)
  - Examples
    - Whole transcriptome template ~20,000 genes
    - Modified transcriptomic template ~3000 known responsive genes
- Using benchmark concentration modeling and determining optimal endpoints for derived transcriptomic PODs
- Considers high-throughput in vitro bioactivity together with high-throughput toxicokinetic modelling

CHRIS CORTON

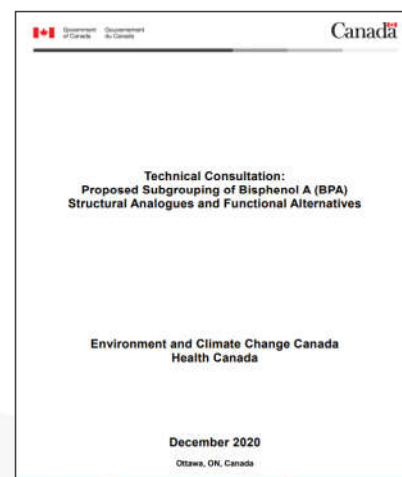

# REGULATORY CONTEXT - BISPHENOL PRIORITIES IDENTIFIED IN 2017-2018

- Certain bisphenols from the 2017-2018 assessment priorities review (IRAP) cycle included a diverse list of chemical structures
- As starting point for problem formulation there were 31 *structurally* similar and 8 *functionally* similar substances
- Computational approach was applied to identify a broader set of substances for further exploration (grouping approaches)

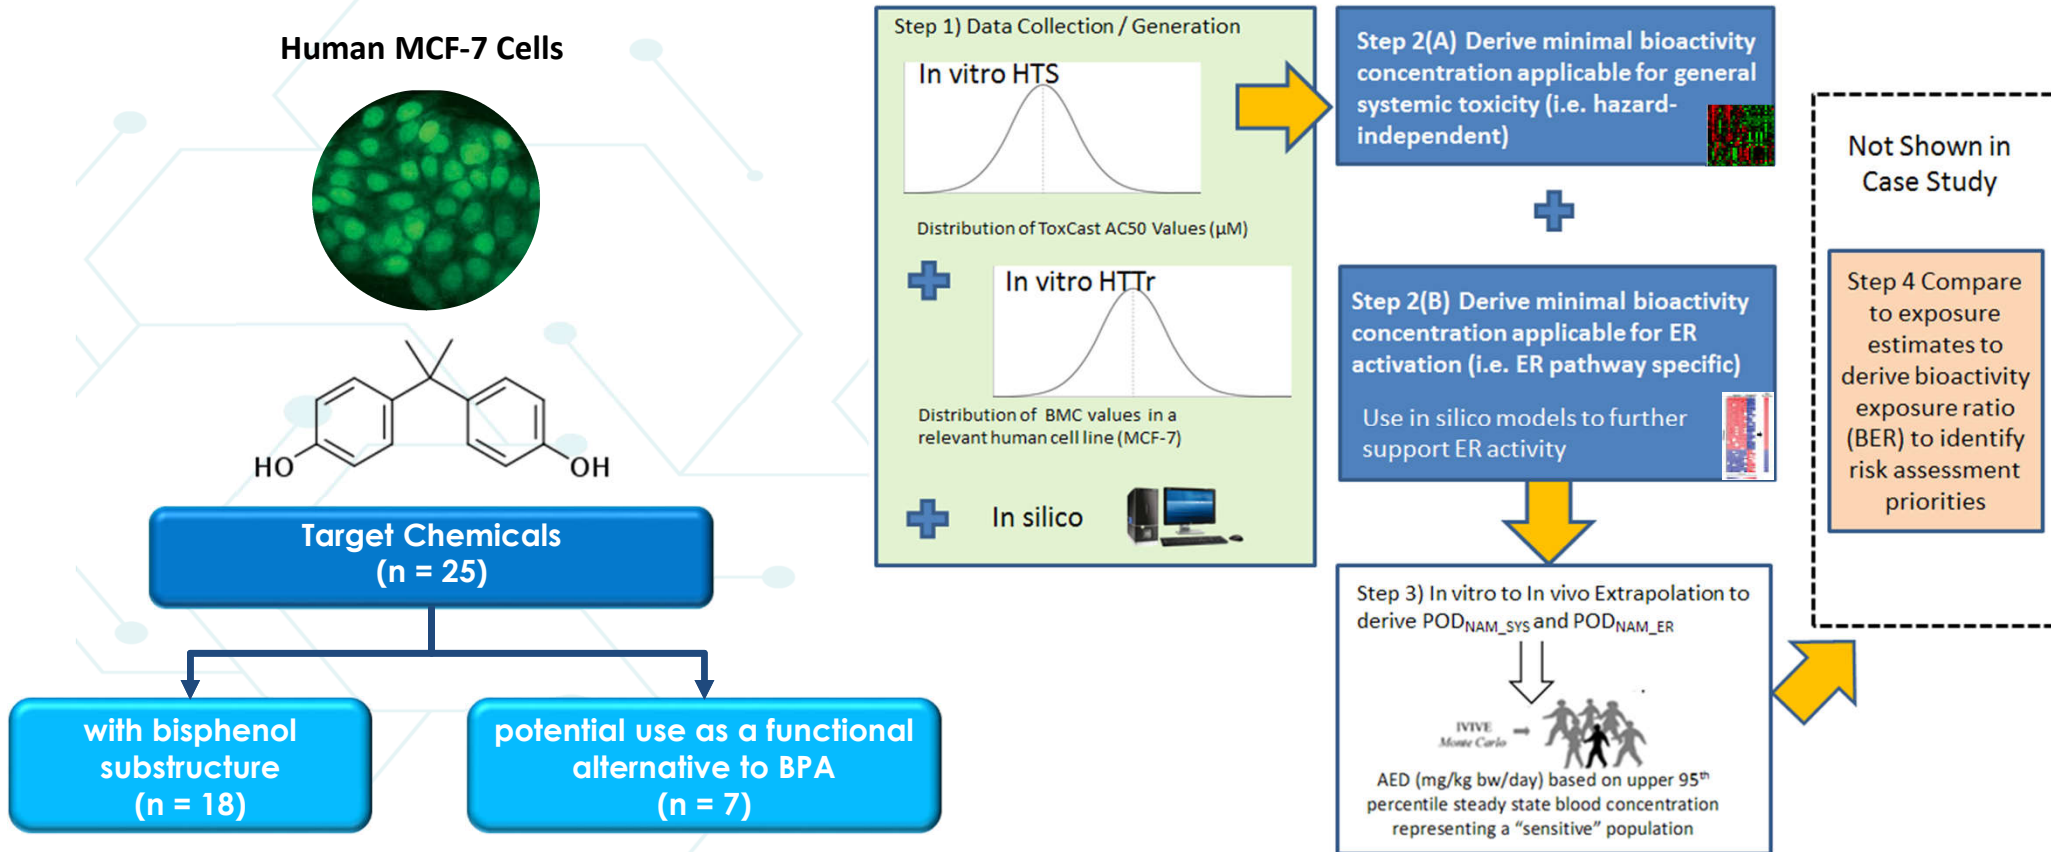

343 unique chemicals were identified

Methods to identify, triage and subgroup\*

IATA to Support Screening and Assessment of Endocrine Active Substances: Bisphenols

Focus on Integrating Transcriptomics and Biomarker Signatures

# INCORPORATING TRANSCRIPTOMICS IN REGULATORY DECISION-MAKING

Thousands of genes per chemical and each exposure

Extraction:  
predictive signatures and pathways

Applied parameters identifying genes with a concentration-response

Dose-response modeling

Establish Points of Departure (PODs)

- How do we define the optimal POD?
- 5<sup>th</sup> percentile
  - 25<sup>th</sup> ranked gene
  - 1<sup>st</sup> mode BMC
  - Lowest median gene set (KEGG, GO, REACTOME)

mathematical models identify defined response above background

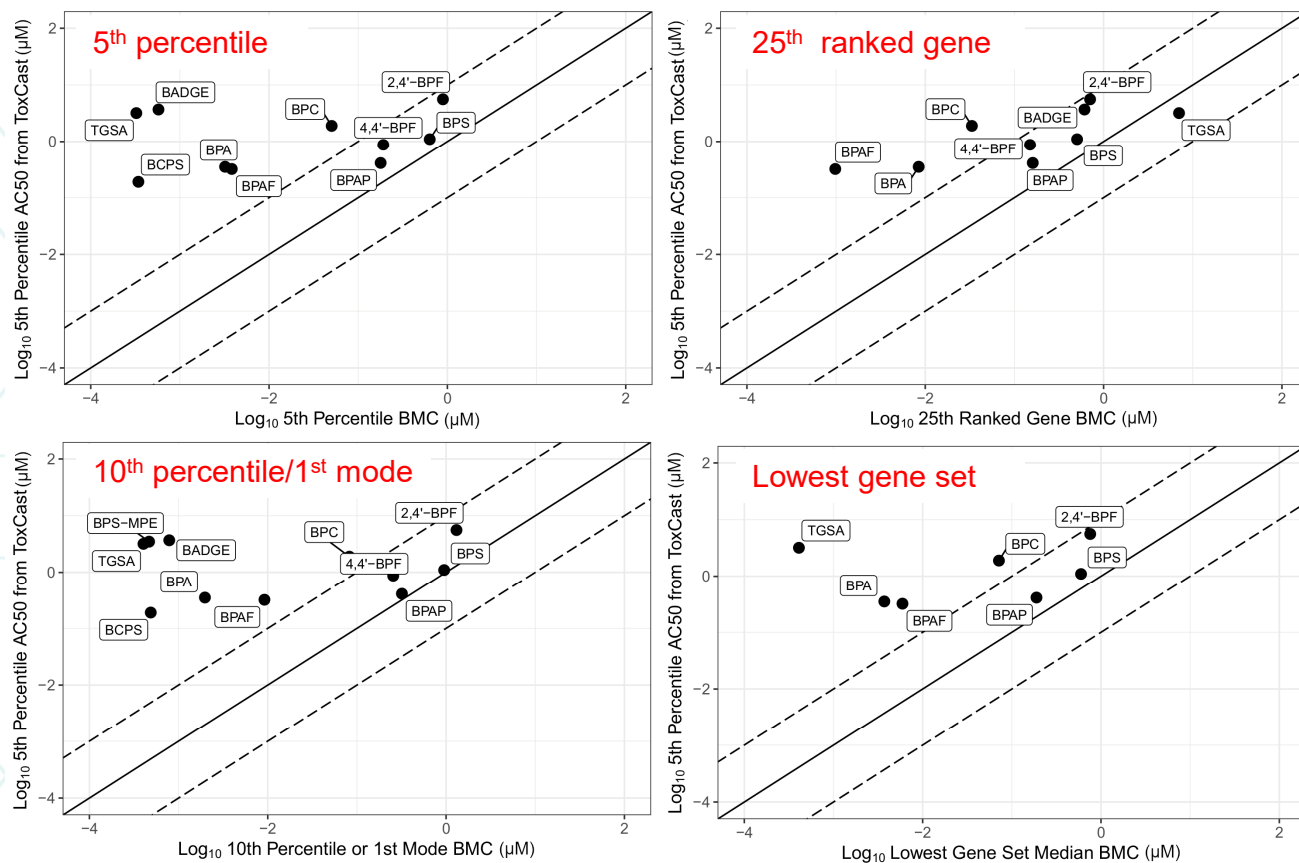

Benchmark Concentration (BMC) accumulation plots

## RESULTS

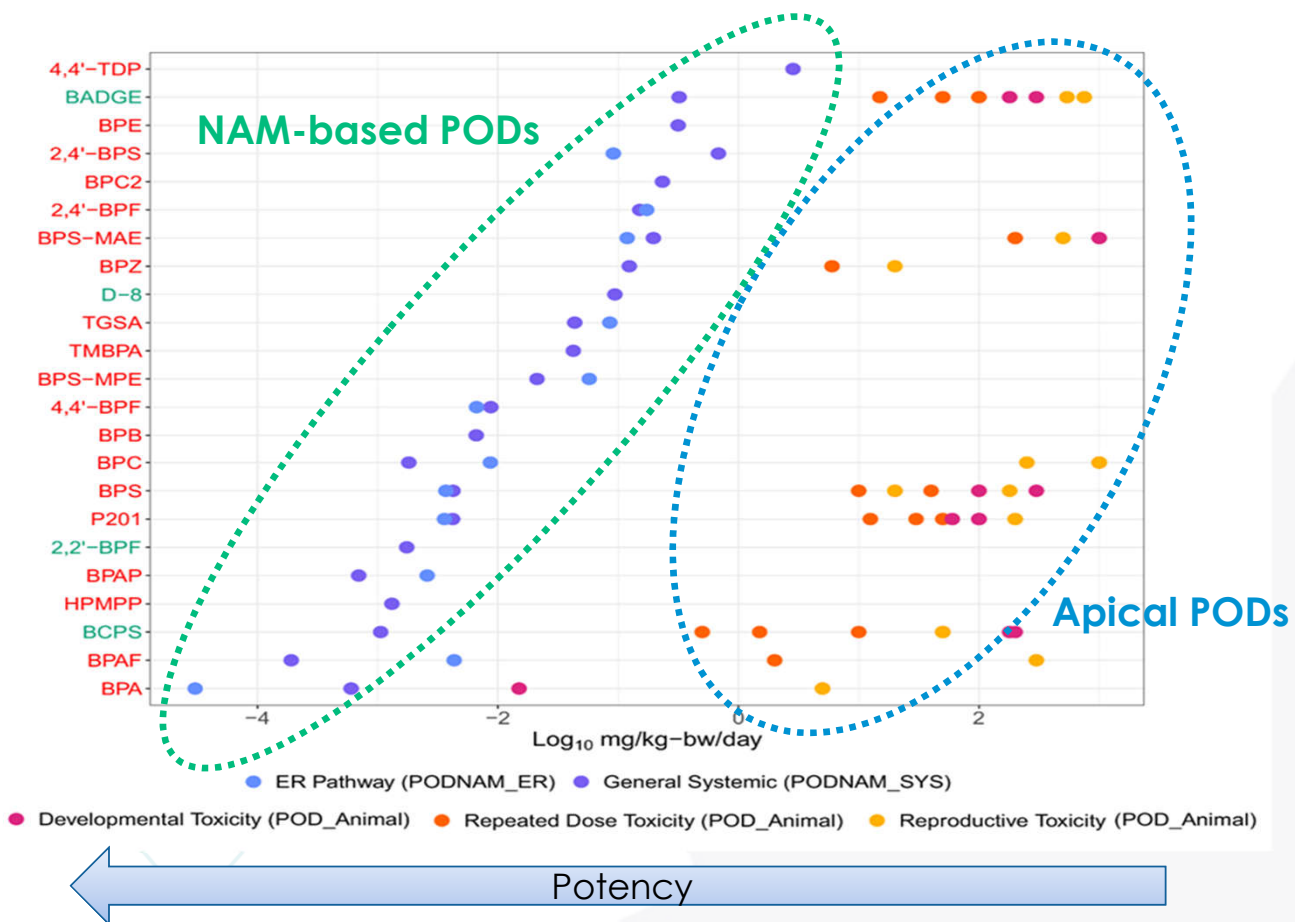

- Several approaches may be considered for establishing NAM-based points of departure for bisphenols and related chemical substances
- Specific approaches (e.g., 25<sup>th</sup> ranked gene) demonstrated robust data, as transcriptomic-derived endpoints, agreed with endpoints derived ToxCast dataset
- Substances exhibit pathway-specific activity (ERa agonists) and demonstrated to have endocrine disrupting properties

### Agreement of BMCs with ToxCast AC50 values

## COMPARISON OF NAM-BASED POINTS OF DEPARTURE WITH APICAL ENDPOINTS

- Chemicals considered ER active based on weight of evidence from *in silico* models listed in red
- NAM-based PODs are useful endpoints for **prioritization** and **potency ranking**
  - General toxicity and pathway derived PODs are in good agreement
- Typically lower than animal-based PODs indicating that they are more conservative

POD = point of departure

# IN VITRO MODELS – CHALLENGES AND OPPORTUNITIES

## Bioinformatics pipelines

- Multiple means of handling and processing data

## In vitro to in vivo extrapolation (IVIVE)

- Software capabilities
- Model assumptions

## Influence of the design

- Models
- Exposures
- Platforms

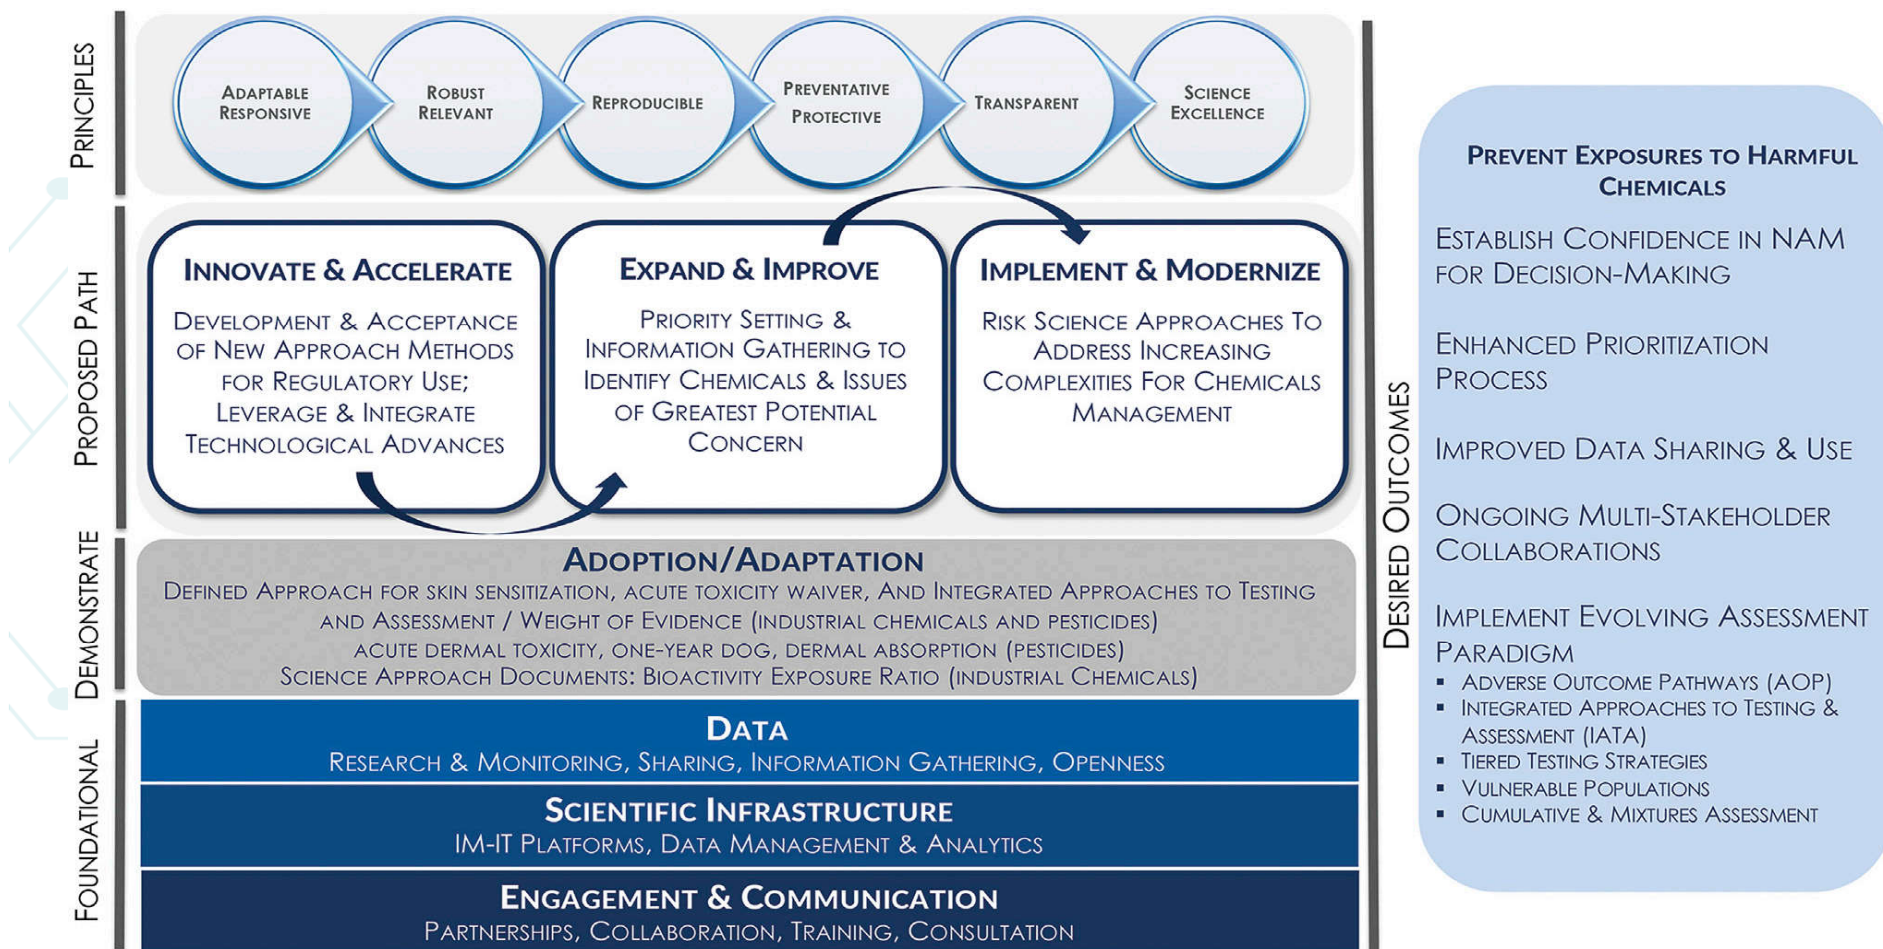

## Points of departure

- Dose-response models
- Acceptable universal metrics

## Relevant values

- Meaningful outcomes (Bioactivity exposure ratio)

# WHERE THE RUBBER MEETS THE ROAD – ACHIEVING RESULTS IN PARTNERSHIP THROUGH INNOVATION AND IMPLEMENTATION

## KEY MESSAGES

- The time is now to innovate and develop fit-for-purpose approaches to increase efficiency and improve protection.
- Key international regulatory jurisdictions are committed to reduction / elimination of animal testing – they are pivotal data sources for risk assessment; we need to keep pace and align internationally.
- Research-Regulatory collaborations are imperative.
- Continue to build a common vision and commitment to advance alternative methods and maintain excellence in science based decision making.
